

ArcGIS Enterprise 11.5

- Ports used for communication between machines in the same ArcGIS Server site, portal, or individual data store.
- Single direction communication between components or sites.
- Ports must be available on each machine. No external communication is needed.
- Inbound & outbound communication between components or sites.

¹ These ports are also needed to communicate with federated ArcGIS Server sites that use web hooks.

² When you use ArcGIS tools to deploy on Amazon Web Services or Microsoft Azure, the object store may use a cloud service location instead of ArcGIS Data Store.
